EXIT
WORK
$\mathbb{L}_G : \text{D-mod}_{\frac{1}{2}}(\text{Bun}_G) \to \text{IndCoh}_{\text{Nilp}}(\text{LS}_{\check{G}})$
why Nilp?
COARSENING
$\Psi_{\text{Nilp},\{0\}} \circ \mathbb{L}_G \simeq \mathbb{L}_{G,\text{coarse}}$
$\text{QCoh}(\text{LS}_{\check{G}})$ enough?
no: misses singular support
TORUS CASE G = T
$\text{D-mod}(\text{Bun}_T)$
FM^{enh}
$\text{QCoh}(\text{LS}_{\check{T}})$
$\text{QCoh}(\text{Bun}_T)$
FM
$\text{QCoh}(\text{Bun}_{\check{T}})$

KNOWLEDGE REGION

Example role · Process engineering problem

Knowledge region for one open role · illustrative example data

LEGEND

- simulated (majority)
- real humans
- agent systems

Crosses mark cluster centres.
Distances normalised to region radius = 1.0, not measured.
Illustrative example,
not a real role or data.

BEHAVIORAL ANALYSIS

Exploit-heavy
Sticks with the first approach that works and refines it, rarely trying alternatives.

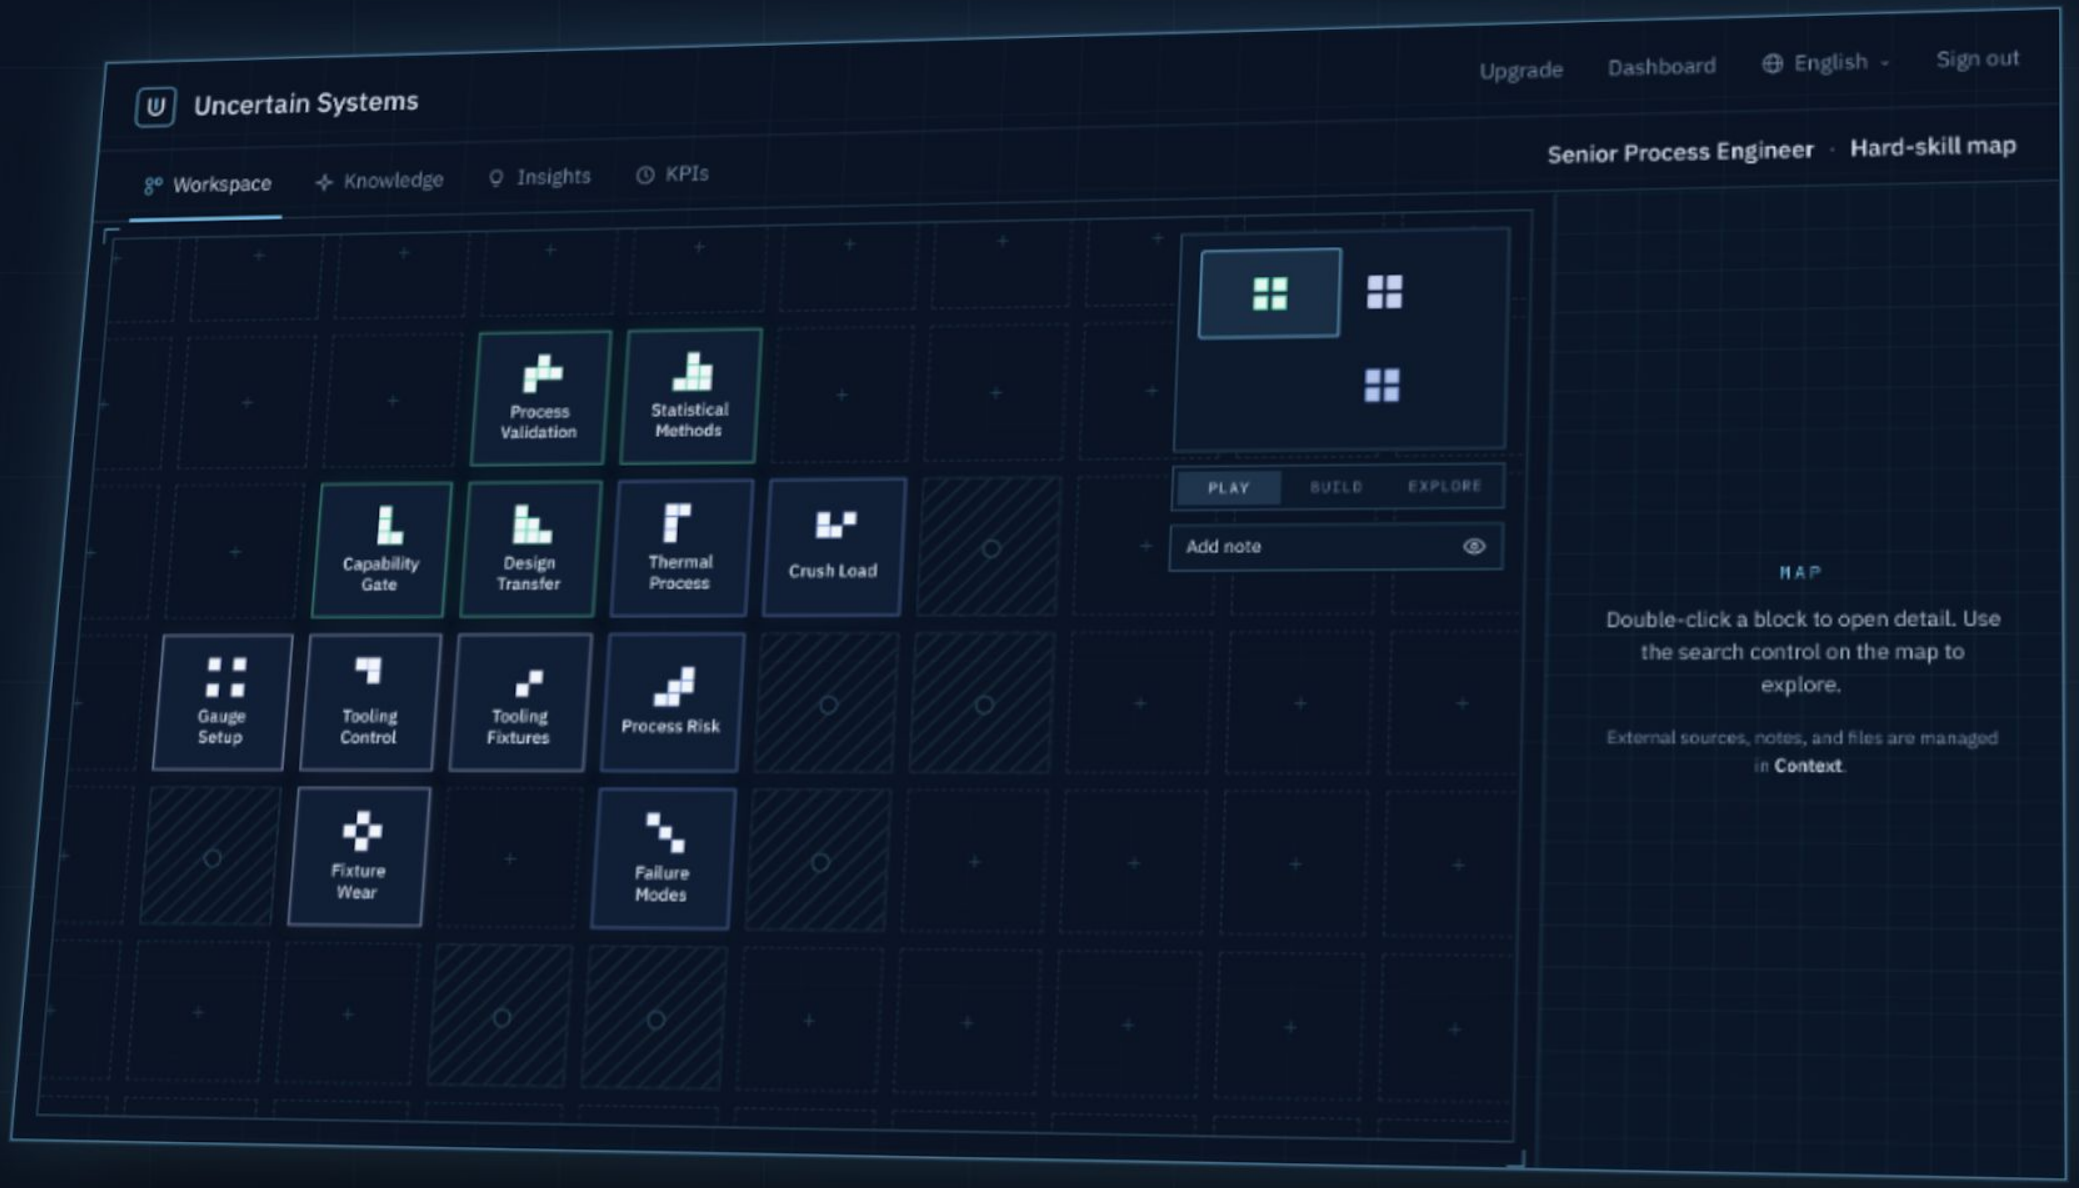

Information-seeking
Asks questions and gathers facts to reduce uncertainty before committing to an approach.

Novelty-seeking
Tries unusual or untested approaches, even when a known one would do.

Balanced
Switches between exploring new options and exploiting what works as the problem unfolds.

Narrow and deep
Picks one line of reasoning early and pursues it in depth, building detail over breadth.

Strategies are simulated with agents; real sessions are placed by how they actually worked.
